TITLE: On the Causes for the Formation of Cracks in Tube Ingots (K voprosu o prichinakh obrazovaniya treshchin na trubnykh slitkakh)

PERIODICAL: V sb.: Staleplavil'n. proiz-vo. Moscow, Metallurgizdat, 1958, pp 115-126

ABSTRACT: A statistical analysis of data from melt data sheets is used to determine the influence of the major procedural factors upon rejection of tube ingots due to longitudinal cracks. The following factors contribute to crack formation: After-teeming of molten pig iron, which gives rise to an increase in the temperature of the metal upon tapping (rejects from such heats come to 10.1%, 6.2% being due to cracks); an increase in the duration of the pure boil period; and increase in metal temperature. 0.85-1.1 kg Al/t for steel deoxidation, [S] within the limits investigated (0.028-0.043%), and the Mn/S ratio do not affect the quantity of cracks in ingots. Cracks form primarily as the result of failure of the linear rate of filling of the molds with metal to

Card 1/2

SOV/137-58-9-18667

On the Causes for the Formation of Cracks in Tube Ingots

correspond to their temperature. It is found that the temperature of the metal on tapping should be 1510-1520°C in the runner (pyrometer reading), the pure boil should last <50 min, and pouring rate should be 0.15-0.20 m/min. Substitution of bunker oil for carbonaceous lacquer as the mold coating reduces ingot rejects almost 50%. Fe-Ti proved to be effective in the deoxidation of the metal. To prevent the formation of hot cracks in round ingots due to the erosion of globulite skin and the uneven distribution of metal temperature across the ingot cross section (due to a nonvertical direction of the stream on emerging from the buffer brick) it is recommended that a stream-equalizing nozzle be employed.

TITLE: A Method of Establishing Firm Time Standards for Welding and Casting Operations (Metodika sozdaniya ukreplennykh normativov na svarochnyye i liteynyye raboty)

PERIODICAL: Sots. trud, 1957, Nr 8, pp 88-92

ABSTRACT: Methodological instructions prepared by the heavy-machinery VPTI for establishment of time standards based on motion study for welding and casting operations are presented. Consolidated time standards (TS) for welding jobs are developed on the basis of specific quotas for the component operations. Depending upon the degree of consolidation, the standards may fall into three categories: 1. TS for the complex of operations and change-overs performed by the welder. An example is given of the compilation of a TS for the complex of operations involving non-operative time in setting up an automatic welder at the start of a seam and shutting it off after the weld is made. 2. TS for actual working time only in welding one running meter of weld. All the elements of the unit-of-production time quota

Card 1/2

137-58-6-12654

A Method of Establishing Firm Time Standards for Welding (cont.)

are classified into two groups in accordance with the length of the weld and in accordance with the product and the operation of the equipment. 3. Standard quotas for "per-piece" time, developed on the basis of the standard production processes and time standards for component operations. Time quotas for casting operations are set on the basis of analysis and systematization of the results of stop-watch studies of the individual elements in the production process.

Title : The Reflex Mechanism of the Specific-Dynamic Action of Food

Orig Pub : Byul. eksperim. biol. i med., 1957, Vol 43, No 5, 39-42

Abstract : Studies were made of the features of specific-dynamic action of food in dogs following extirpation of the cortex of either one or both cerebral hemispheres using the method of determination of gas exchange recommended by Douglas and Haldane, and by Tsunts and Haldane. Removal of the cortex of one hemisphere led to a certain prolongation of the period of elevated O<sub>2</sub> consumption. The maximum O<sub>2</sub> consumption came on slightly earlier and was only slightly different in magnitude from that in the preoperative state.

TITLE: Investigation of the Heating Process of Moist Capillary-Porous Materials in an Electric HF-Field

PERIODICAL: "Sb.nauchn.tr.Berlorussk.politekm.in-t", 1959, No.74, pp. 141-157

TEXT: The author analytically and experimentally investigated the heating process of moist capillary-porous dielectrics and semiconductors by HF-currents. One can conditionally dismember the total heating cycle into three stages for approximate calculations: 1) heating of the moist body up to the boiling point of the moisture, and 2) elimination of the moisture at  $t=const$  and heating of the dry body. Equations are obtained for determining the time  $\tau$  required for the heating of the body up to the prescribed temperature  $t$ , for determining the body temperature and the body moisture at a given instant, and for determining the maximum vapor gauge pressure at different body points dependently on  $\tau$ . The application of the obtained equations is illustrated by a rated example. A.R.  
Translator's note: This is the full translation of the original Russian abstract.

TITLE: Stabilizing of Sands by Chemical Methods (Zakrepleniye  
peskov khimicheskimi metodami)

PERIODICAL: Sb. nauchn. rabot. Belorus. politekhn. in-t, 1956,  
Nr 54, pp 51-56

ABSTRACT: The authors have developed a new method for surface  
chemical stabilization of sandy soils. The method is  
based on use of a Na silicate solution. The basic  
binding substance in silicatization of sands is not  
silica gel but Ca (or Mg) hydrosilicate. This fact is  
confirmed by tests of B. A. Rzhanitsyn who, in ad-  
dition to Ca chloride, used solutions of other chlorine  
salts and obtained specimens which differed sharply  
in stability. It is not possible to form a hydrate of

Card 1/3

15-57-8-11604

Stabilizing of Sands (Cont.)

Ca (or Mg) oxide by interaction of solutions of Na silicate and Ca (or Mg) chloride, since the hydrate is more soluble than Ca (or Mg) hydro-silicate. The nature of sand stabilizing by silicatization is based on the development, between the particles of sand, of a cement consisting of insoluble silicate with an amorphous structure and capable of producing specimens which are stable in water. Na silicate in the form of a solution of 2-normal and 2.5-normal concentration (with a silicate modulus of 2.7) was used for this purpose. Sulfuric acid salts of Mg, Zn and Al, Mn, Fe and Cu, used in the form of small crystals, served as the second component of the reaction. Crystal size was from 0.25 mm to 1 mm. Fine-grained sand was used, with particles of uniform diameters and a porosity of about 40 percent. A layer of sand 10 cm thick was mixed with a properly calculated amount of sulfuric acid salt, and a solution of Na silicate of appropriate concentration was poured over it. The crystals of the sulfuric acid salt, uniformly distributed in the sand, leave passages for the flow of the soluble silicate to the necessary  
Gard 2/3.

Stabilizing of Sands (Cont.)

15-57-8-11604

depth (10 cm); about four minutes are required for total penetration. The entire specimen hardens into a solid mass after 15 or 20 minutes. The specimens were taken out of the mold after three days and were immersed in water. They did not lose their stability even after a year's storage in water, were not changed during their submersion, and their permeability remained at 3 000 to 8 000 times below that of the initial sand specimens. Mg sulfate, used in the amount of 10 to 12 percent, is the cheapest and most suitable sulfuric acid salt for this work.

Abstract : Aqueous solutions of mixtures of sodium silicate and salts of divalent or trivalent metals (for example  $MgSO_4$ ), on being introduced into a sandy soil render the latter mechanically strong (critical point on compression up to  $8 \text{ kg/cm}^2$ ). Replacement of  $1/3$   $MgSO_4$  by technical boric acid increases strength of the sandy soil.

TITLE: New Porcelain Low-Voltage Grain Filler Fuse Cutouts  
(Novyye farforovyye nizkovol'tnyye nasypnyye predokhraniteli)

PERIODICAL: V sb.: Raboty M-va elektrotekhn. prom-sti SSSR po mekhaniz. i  
avtomatiz. nar. kh-va, Z. M., 1956, pp 164-166

ABSTRACT: A description, a picture, and a mounting sketch with dimensions are presented of a new line of low-voltage porcelain grain-filler fuse cutouts, PN2 series, manufactured by Kurs'k Factory of Low-Voltage Equipment for rated currents of 100, 250, 400, and 600 amp. The new fuse cutouts are intended for AC standard-frequency installations up to 500 v, and differ from the older PNR line of the same factory in their smaller size, in porcelain-tube construction, contact blades, and fusible links, and also in their higher interrupting rating. The new cutout weighs 27.6-41.8% less than the older type, depending on the current rating. Also, it requires less steel and copper than the

Card 1/2

sov/112-58-1-500

New Porcelain Low-Voltage Grain-Filler Fuse Cutouts

older one. Unlike conventional round cross-section porcelain tubes, the new cutout has a square cross-section tube. Under test conditions, the new cutouts repeatedly interrupted 3-phase currents of 300-27,000 amp rms at 440 v, at power factor 0.12-0.2. The new cutout has a detachable handle for replacing fuse units.

Title : The Characteristic of Nidus of a Tick Rickettsiose in the South-East of Turkmenia.

Orig Pub : Zh. mikrobiol., epidemiol. i immunobiologii, 1957, No 7, 114-121

Abstract : The presence of ticks *Hyalomma asiaticum* naturally infected by rickettsias was established in one of the districts. The isolated rickettsia strains are pathogenic for guinea pigs, white rats, young white mice (weight not more than 10 grams) and chick embryos. These strains are morphologically close to *Dermacentroxis sibiricus*, *D. murinum*, *D. conori* and are different from the latter in their ease toward polynuclearization. The authors ascribe the

Card 1/2

Abs Jour : Ref Zhur - Biol., No 15, 1958, 67007.

isolated rickettsias to a separate species of the genus Dermacentroxenus under the name of D. deserti pavlovskyi. Because of the presence under natural environment of hungry ticks H. asiaticum, infected with rickettsias and the transovarial transmission of infection, the authors think that the ticks are carriers.

AUTHOR: Bogdanov, M. N.; Kalmykova, V. D.; Mandrosova, F. M.; Zhmayeva, I. V.; Okromchedlidze, N. P.; Sedykh, N. V.

TITLE: Synthesis and properties of fiber-forming polyalkyleneterephthalamides

SOURCE: Geterotseptye vysokomolekulyarnye soyedineniya (Heterochain macro-molecular compounds); sbornik statey. Moscow, Izd-vo "Nauka," 1963, 37-41

TOPIC TAGS: synthetic fiber, artificial silk, terephthalic acid, terephthalamide, polyalkylene terephthalamide, Alpha Omega diamine, Kapron

ABSTRACT: A large number of polyamides based on terephthalic acid and unbranched  $\gamma, \omega$ -diamines with 8-16 methylene groups in the chain were synthesized and investigated with respect to their thermomechanical properties. The methods and conditions of synthesis are described. Effective additives were the aromatic hydroxy compounds, such as the isomers of hydroxyphenyl- and hydroxydiphenyl-methane, which in an amount of 30-50% gave spinnable high-molecular-weight polyamides resistant to crystallization up to 320-340°C. These are very suitable for spinning high-melting fibers. The limiting temperature of crystallization for polyamides from various terephthalates decreased to 280°C or below. The synthesized polyamides were high-melting, strong, white substances, soluble only in concentrated

cord 1/2

ACCESSION NR: AT4033982

H<sub>2</sub>SO<sub>4</sub>. The thermal stability of the resulting fibers was tested by strength loss at 140°C. A comparison of the thermodynamic curves of synthesized high-melting monofilaments and polycaproamide filaments showed that the differences in the relative variation of fiber length during heating are relatively small and the maximum difference in the temperature of incipient deformation does not exceed 40°C. Fibers made from polyalkyleneterephthalamide, regardless of the much higher melting point, differ only slightly in thermal stability from Kapron fiber. The conditions of preparation and the properties (viscosity, melting points) of various polyalkyleneterephthalamides as well as the spinning conditions and fiber properties (strength, etc.) are tabulated. Orig. art. has: 1 figure and 3 tables.

"Domestic Fowl as Carriers of Q Fever Rickettsia in the Turkmen SSR," by Z. M. Zhmayeva and A. A. Pchelkins, Institute of Epidemiology and Microbiology imeni N. F. Gamaleya, Academy of Medical Sciences USSR, Zhurnal Mikrobiologii, Epidemiologii, i Immunobiologii, No 3, Mar 57, H 39-41

The work reports on the discovery of Q fever and its pathogen, R. burneti, in the Turkmen SSR by an expedition from the Institute of Epidemiology and Microbiology under P. A. Petrishchev in 1953. The pathogen was isolated from human patients, two species of ticks (*Hyalomma anatomicum* and *Ornithodoros tartakovsky*), one species of mites (*Leeuwenhoekia major*), and two species of susaliks.

In 1954, studies were made of the epidemiological significance of domestic fowl in a region 70 km southwest of the Amu-Dar where two cases of positive complement fixation reactions had been reported. After elimination of any other contacts, the infection was traced to the consumption of raw eggs. Large numbers of the Argas persicus mite were found on the chickens; therefore, to prove the spontaneous carrying of rickettsia by chickens, suspensions of brain and kidney tissues from two roosters were prepared and 4 ml of the suspension injected into the abdominal cavities of two guinea pigs. Within 11 days, both animals developed a fever which lasted 14 days. Experiments were continued with various internal organs of guinea pigs, and examination showed light hyperemia of the lungs, an increase of the spleen to three or four times its normal size, and hyperemia of the kidneys. At the spot where the suspension had been injected subcutaneously into the leg, a serous-morrhagic infiltrate developed. Upon a second passage through the guinea pigs, conglomerates of cocciform rickettsia were found at the injection point.

The authors conclude that Q fever can be transmitted through the consumption of raw eggs and that chickens can form a reservoir of the Q fever pathogen. (U)

TITLE: Natural tick-borne typhus focus in the Tula region

SOURCE: Meditsinskaya parazitologiya i parazitarnyye bolezni, v. 35, no. 4, 1966,  
470-474

TOPIC TAGS: epidemiology, rickettsia disease, disease vector, typhus, tick, animal parasite

ABSTRACT: A new, natural focus of tick-borne typhus has been discovered in the Tula region and confirmed with complement-fixation tests on cows. *Dermacentor pictus* ticks inhabit the entire region (except large forests), feeding on elk and hares when mature and field mice or other small mammals before maturity. Mature ticks are prevalent from late April—late May and immature ticks from July—August. Rickettsia isolated from mature ticks collected in this region were identified as belonging to the species *Rickettsia sibirica*. Periovarian transmission of rickettsia

during tick metamorphosis was established. Complement-fixing antibodies to *Rickettsia sibirica* were found in only 2 of 50 Tula inhabitants tested, which agrees with the normally rare Infestation of man by *Dermacentor pictus*. [WA-50; CBE No. 12]
